

BOARD REVIEW 1 PACKET

Tarcie Guided Beta Sessions

Preloaded product assignments, Start Session coverage, End & Review writable PDF, and three-platform qualification

Plan ID	BDS-TARCIE-BETA-EVIDENCE-v0.2
Prepared	2026-08-15
Decision owner	Charlie Boswell
Status	Proposed for Board Review 1 - no implementation authority
Lineage	Candidate successor to v0.1; v0.1 remains controlling until explicit authorization

Recommended disposition: AUTHORIZE GATE-00 and documentation-only Phase 1 contract, fixture, threat-model, PDF-prototype, and qualification-plan work - with fail-closed conditions.

Executive proposal

Forge_Command prepares one bounded .tarcie-session assignment for an exact product, build, tester, and set of product sections. The tester loads the package into Tarcie on Windows, macOS, or Linux. Start Session presents assigned and optional work. Tarcie preserves its fast capture overlay while a separate Session Hub tracks coverage. End & Review displays a locally generated writable PDF report. Finalize binds the PDF, structured report, observations, artifacts, and hashes into a local candidate evidence package.

Tarcie remains a human companion, not the autonomous Beta by Forge campaign controller. It does not navigate Author_Forge, diagnose with authority, repair, promote, deploy, or automatically create GitHub issues.

Binding product requirements

Session preparation	One reusable Tarcie installer plus a separate assignment package; never a per-tester application build.
Start Session	Display exact product/build, tester assignment, sections, guardrails, remaining work, and free-exploration allowance.
During session	Bind observations to session and section while preserving the fast overlay.
End & Review	Enter reversible report review and display a writable PDF already populated from session facts.
Finalize	Validate required work, evidence review, PDF fields, structured report, and hashes; create local candidate package only.
Platforms	Tarcie and Author_Forge must be installable and operational on Windows, macOS, and Linux.

Authority architecture

Component	Authorized responsibility	Prohibited responsibility
Forge_Command	Profile and assignment preparation, lifecycle authority, intake validation, receipts, operator review	Source-evidence rewriting; unapproved repository mutation
Tarcie	Human guidance, local session state, observations, explicit artifacts, writable closeout	Autonomous testing; diagnosis; repair; promotion
DataForge Local	Durable accepted facts, artifacts, versions, and receipt references	Severity, verdict, workflow, or promotion authority
Forge:SMITH	Policy evaluation and Board presentation	Changing source observations
Human tester	Start, pause, capture, correct, redact, report, approve	Receiver acceptance or repository authority

Lifecycle and evidence truth

NO_PACKAGE -> READY -> ACTIVE <-> PAUSED -> REVIEWING -> FINALIZED. End & Review is reversible. Only Finalize closes the session. Capture, finalization, submission, receiver acceptance, candidate finding, and GitHub issue creation are separate governed transactions; no earlier state implies a later one.

Original tester observations remain immutable. Corrections, exclusions, redactions, reviewer annotations, and conclusions attach by identity. HTTP success without a hash-bound per-item receipt is not acceptance.

Writable PDF contract

Tarcie generates the report locally from a trusted versioned template. The PDF may not contain JavaScript, launch actions, embedded files, or network content. Read-only facts include product/build/session identity, times, source IDs, and hashes. Writable fields include coverage states, section comments, expected/observed narratives, reproduction steps, unresolved work, overall experience, privacy review, and attestation.

Every field is bound to the same structured field map used by BetaSessionReport.v1. Tarcie saves, reopens, and validates the AcroForm field tree, page widgets, values, and appearance streams before finalization. The final PDF and structured report hashes are bound together.

Board findings

Architecture

A separate Session Hub preserves the fast overlay. Session packages are data, never executable content. Forge_Command remains the control plane.

RED Board

Block traversal, executable package content, secret/manuscript leakage, silent or overbroad screenshots, raw-pixel survival, active PDF features, false acceptance, and platform fallback.

Evidence Board

Bind exact product/build/session identity, immutable observations, section coverage, PDF bytes, structured report, artifact hashes, and per-item receipts.

Privacy and Accessibility

Tester review is mandatory. All states and report fields require keyboard, screen-reader, text/icon, and non-canvas alternatives.

Operations

Build artifacts are not support proof. Windows, macOS, and Linux each require installed core-workflow receipts for both Tarcie and Author_Forge.

Gated roadmap

Gate	Scope	Exit evidence
0	Current-source lock	Independent clean source/build ledger and ownership decisions
1	Contracts and fixtures	Strict schemas, canonical hashes, negative fixtures, PDF field-map proof
2	Session loader	Non-executable package validation and separate Session Hub
3	Lifecycle	Crash-safe Start, Pause/Resume, End & Review, Finalize
4	Guided capture	Session/section-bound observations and explicit qualified artifacts
5	Writable report	Cross-platform PDF save/reopen, field round-trip, and finalization binding
6	Receipt handoff	Fixture-backed localhost intake and hash-bound per-item receipts
7	Installed qualification	Windows, macOS, and Linux complete core-workflow receipts
8	Limited beta / BR2	Disposable Author_Forge runs and explicit release decision

Exact bounded authorization requested

AUTHORIZE BDS-TARCIE-BETA-EVIDENCE-v0.2 for GATE-00 current-source lock and documentation-only Phase 1 contract, schema, canonicalization, fixture, threat-model, wireframe, PDF-prototype, and cross-platform qualification-plan work. This authorization permits no runtime implementation, repository mutation, screenshot permission, personal or production content ingestion, live beta enrollment, production DataForge write, Forge_Command delivery, network or cloud transport, credentials, deployment, automatic issue creation, autonomous testing, diagnosis, repair, promotion, or release claim. Any code work requires a separate operator-authorized work package bound to the completed GATE-00 ledger and approved schemas.

Rejection triggers

Reject or return for rework if the package can execute content; receiver or storage ownership remains ambiguous; writable PDF values cannot round-trip without loss; active PDF content is required; screenshot scope cannot fail closed; original evidence can be silently changed; platform support is inferred from build artifacts; or Tarcie gains autonomous, issue, repair, promotion, or release authority.

Source and claim limits

Subject	Observed source	Claim limit
Tarcie	main @ 7ad58c601312baaf9880bc3120a47e1b77bb34ed	Connector-observed; clean reproduction pending
Author_Forge	main @ 5b7765113ead1465f4d8a3802abfc7e34e8a9b07	Cross-platform workflow exists; installed parity not established
Forge_Command	main @ 87fd7f11ad088079949f15a17752c93c29782fdb	Receiver ownership unresolved
dataforge-Local	master @ 6c07d13d31a6f6c07789cc23429d1b474ec0816a	Production persistence contract unresolved

This packet is documentation-only. It records a candidate design and requested decision; it is not proof of implementation, platform support, live beta readiness, or production evidence authority.
